

# Ahhh is the new moo.

---

Learn how you can maintain cow  
comfort during dry-off.

# Every lady deserves to dry off comfortably.

Bovikalc® Dry is an oral mineral supplement that maintains cow comfort by reducing milk production at dry-off. The reduction of milk production is beneficial for udder health because it decreases udder engorgement and pressure, which helps reduce discomfort.

## Top reasons to use BOVIKALC Dry:

- 1 Maintains comfort during a crucial moment in the lactation cycle**  
Drying off is the most important phase of the lactation cycle because it prepares the cow and her udder for the next lactation.
- 2 Reduces udder pressure**  
Decreased milk production leads to a reduction in engorgement and thus, udder pressure.<sup>1</sup>
- 3 Decreases risk of milk leakage**  
Lower udder pressure diminishes the risk of milk leakage.<sup>1</sup>
- 4 Promotes longer lying time**  
Maintaining comfort encourages a longer lying time, which is important for the health and welfare of cows.
- 5 Makes a difference without complicated changes to your dry-off protocol**  
BOVIKALC Dry helps maintain cow comfort at dry-off without the implementation of any additional management changes.
